Smith, Jenefer M. Blackwell, Kenneth D. Stuart, Bart Barrel, Peter J. Myler (2005) The Genome of the Kinetoplastid Parasite, *Leishmania major*. *Science*;309(5733): 436-42.

Outline

- Why Study Leishmania
- Research Methods
- Genome Structure and Contents
- Significant Genetic Findings

http://www.uni-tuebingen.de/modeling/Mod_Leish_Intro_en.html

Why Study Leishmania

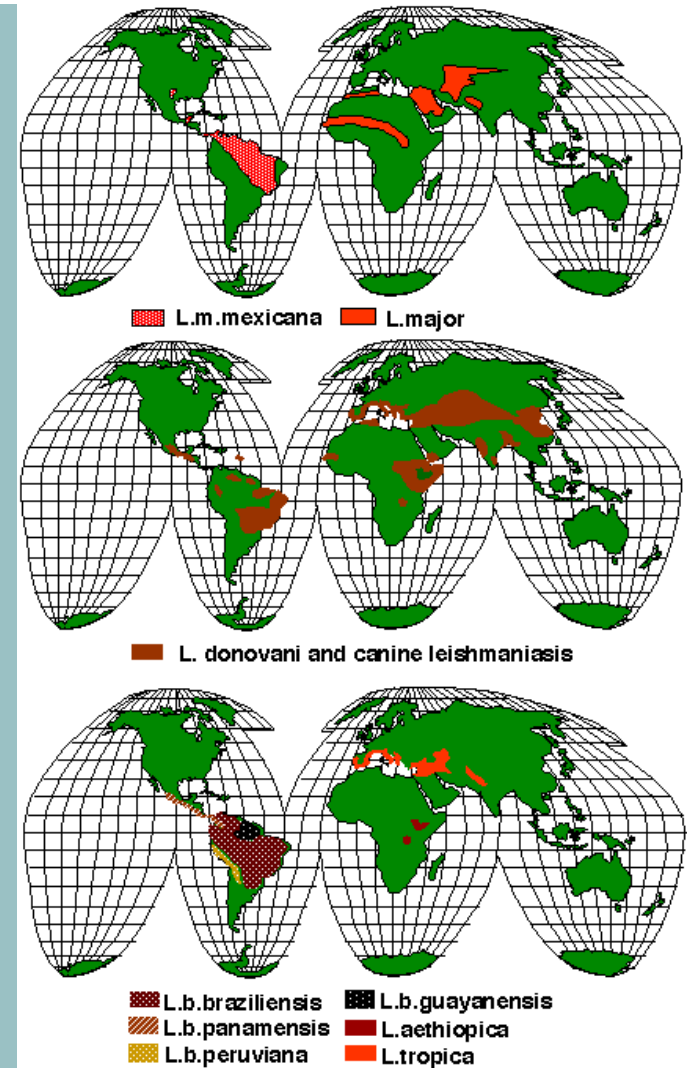

- Major pathogenic parasite
- 2 million infections in 88 countries annually
- spectrum of diseases: “leishmaniases”

<http://www.icp.ucl.ac.be/~opperd/parasites/images/promast.jpg>

Leishmania is uniquely successful parasite

- Tropic/sub-tropic
- Uniquely adapted to avoid host-destruction
- Thrive and proliferate due to unique glycoconjugates on outside of cells

Symptoms of the Leishmaniases

- Skin sores and ulcers
- Difficulty breathing/swallowing
- Eroding away in mouth, tongue, gums, lips, and nose

<http://anthropology.net/2009/09/10/ancient-leishmaniasis-from-coyo-oriente-cemetery-in-chile/>

<http://adamspencerphotography.com/leishman/>

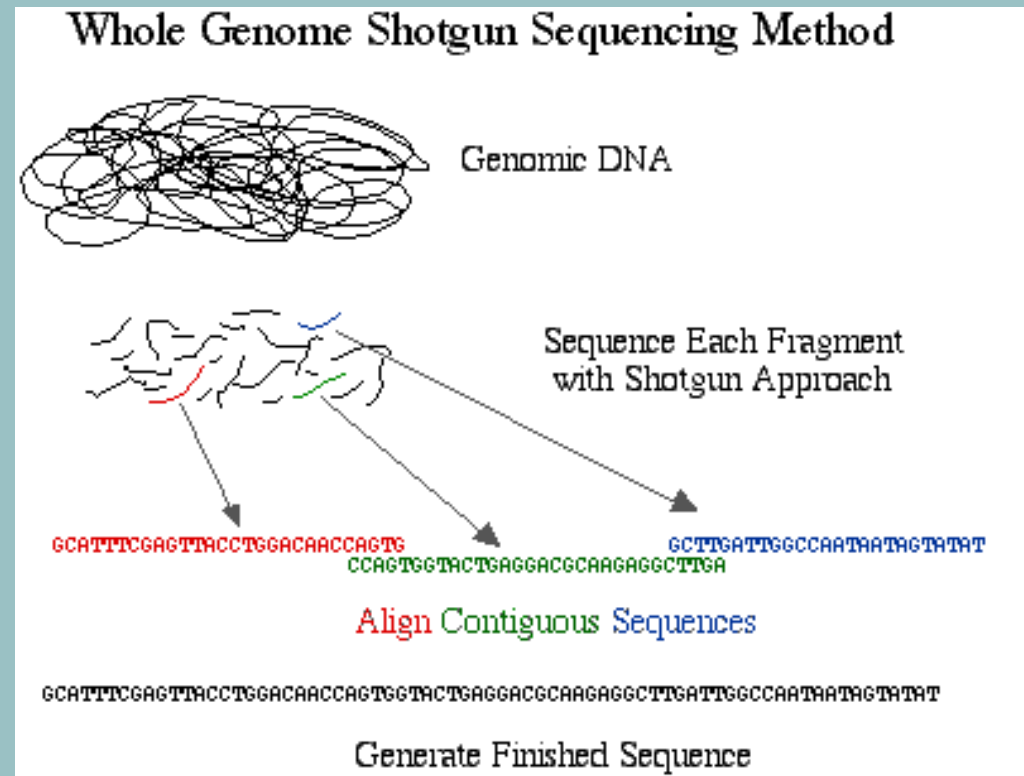

Life cycle of Leishmania

Shotgun Sequencing

- DNA broken up into many segments
- Sequenced to obtain *reads*
- overlapping *reads* assembled to a continuous sequence

→ Sequences compared between 3 trypanosomatids, “trityps”

Leishmania major genome structure and content

- 32,816,678 base pairs
- 36 chromosomes
- Accuracy was compared to an optical map
- Smaller gene families
- Larger gene families

Parameter	Number
<i>The genome</i>	
Size (bp)	32,816,678
G+C content (%)	59.7
Chromosomes	36
Sequence contigs	36
Percent coding	47.9
<i>Protein-coding genes</i>	
Genes	8272
Pseudogenes	39
Mean CDS length (bp)	1901
Median CDS length (bp)	1407
G+C content (%)	62.5
Gene density (genes per Mb)	252
<i>Intergenic regions</i> [*]	
Mean length (bp)	2045
G+C content (%)	57.3
<i>RNA genes</i>	
tRNA	83
rRNA [†]	63
siRNA [†]	63
snRNA	6
snoRNA	695
srpRNA	1

^{*} Region between protein-coding CDS.

[†] The exact number cannot be determined because of misassembly.

Table 1: Summary of L. major genome

Some genes are unique to *L. major* when compared to those in *T. brucei* and *T. cruzi*

- *L. major* telomeres are distinct heterogeneous in structure
- 910 *L. major* genes have no orthologs in other 2 *Trityp* genomes
- “*Leishmania* restricted genes”
 - Randomly distributed in genome
 - Some responsible for metabolic differences
 - 68% have unknown functions

Family size*	Gene product(s)	<i>L. major</i> —specific	Organization†	Chromosome(s)
491	Hypothetical proteins (several annotations)	Some	D	Multiple
189	Kinesins/hypothetical proteins	Some	T+D	Multiple
60	Protein kinases (several groups)	Some	T+D	Multiple
46	Amastins	Most	T+TI+D	8, 31, 34, 36
32	Protein kinases (CMGC group)	One	D	Multiple
32	PSA-2 (GP46)	All	T+D	12, 21, 31, 35
29	RNA helicases/eIF-4a	None	T+D	Multiple
27	ATPase/serine peptidases	None	D	Multiple
29	Hypothetical proteins (kinesin-like)	One	D	Multiple
25	Protein phosphatases	None	T+D	Multiple
25	Tuzins	Some	TI+D	8, 34, 36
24	Protein kinases (STE group)	Some	D	Multiple
23	Amino acid permeases	Some	T+D	Multiple
19	HSP83	None	T+D	29, 33
18	DNA helicases	Some	D	Multiple
18	β-tubulins	None	T+D	8, 21, 33
17	Hypothetical proteins (LACK)	One	D	Multiple
17	Hypothetical proteins	Some	T+D	11, 13, 21, 29, 31, 36
15	Calpain-like cysteine peptidases	Some	T+D	4, 20, 25, 31, 36
14	HSP70 and related proteins	None	T+D	1, 18, 26, 28, 30, 35
14	Phosphoglycan β 1,3 galactosyltransferases	Some	T+D	2, 7, 14, 21, 25, 31, 35, 36
14	Dynein heavy chain	One	D	Multiple
14	RNA helicases	None	D	Multiple
14	α,γ,ε-tubulins	None	T+D	13, 21, 25
13	Hypothetical proteins (PIPK-like protein)	One	D	Multiple
13	Pteridine transporters	Some	T+D	4, 6, 10, 19, 35

Table 2: *L. major* Friedlin protein coding gene families

Two closely related genes of interest: LmjF33.1740 and LmjF33.1750

- Macrophage migration inhibition factor (MIF)
- MIF genes in humans encode a lymphokine protein mediator involved in innate immunity
- L. major MIFs vs. host MIFs
- May modulate host macrophage response to promote parasite survival

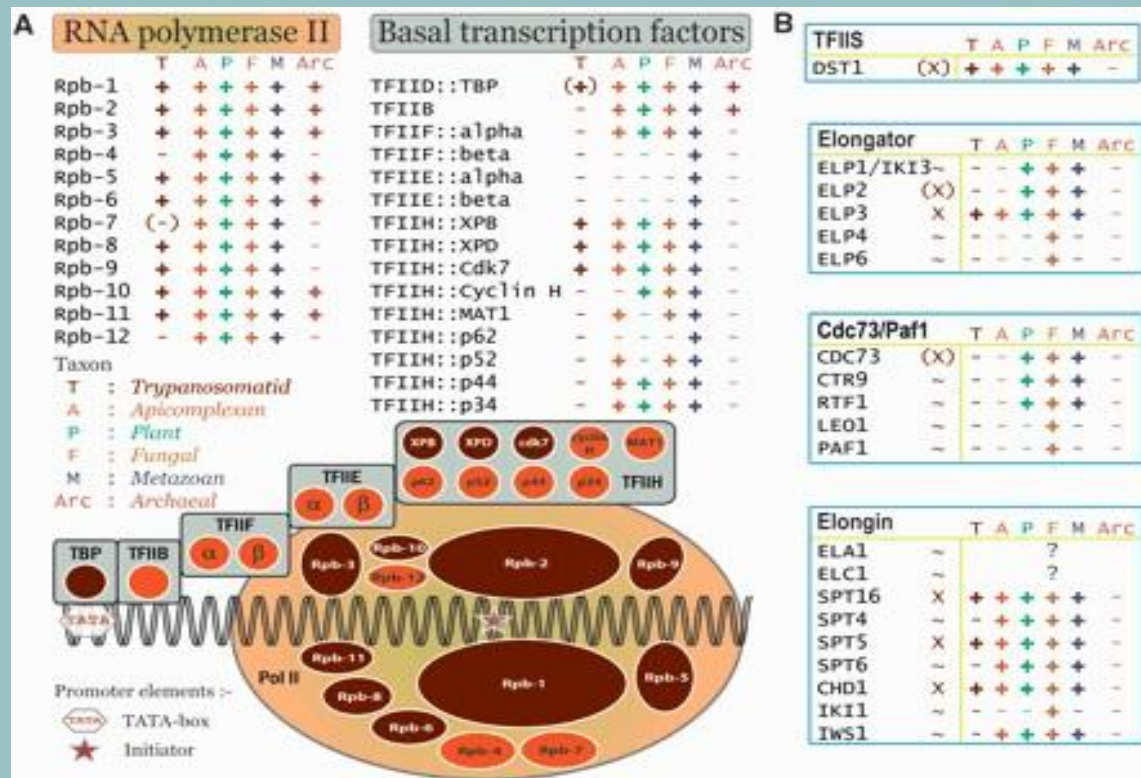

Structure of MIF protein

http://en.wikipedia.org/wiki/Macrophage_migration_inhibitory_factor

Significant Findings- Transcription Machinery of Leishmania Compared to Other Eukaryotes

Figure 1
RNA Polymerase II

- Protein Families
- Subunits
- Transcription Factors

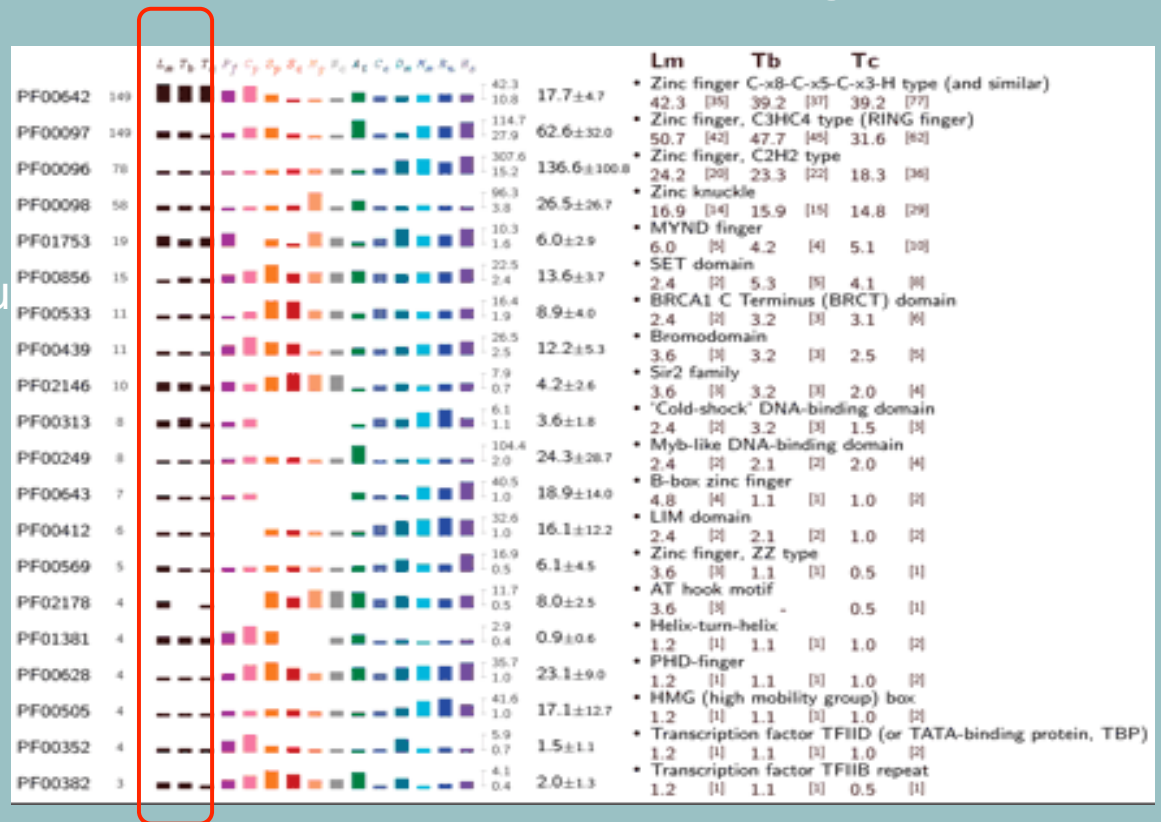

Significant Findings- Protein Families Involved in the Regulation of Gene Expression in Model Eukaryotes

Regulation of Gene Expression

Figure 2-

Gene Expression of Various Protein Domains by Species

Significant Findings- Proteins Involved in Post Translational Modification are Potential Drug Targets

Post Translational Modification

- Protein modification typical of a eukaryote
 - Typical number of genes code for most protein modifications
- High number of genes code for myristoylation and prenylation
- These enzymes could be drug targets due to high number of substrates

Significant Findings- Surface Molecules Unique to Leishmania are Potential Drug Targets

Surface molecules

- Surface molecules critical for pathogenic species
- Primary sphingolipid expressed is Inositol Phosphorylceramide (IPC)

http://lipidlibrary.aocs.org/Lipids/glyP_ino/index.htm

- Not produced in mammals
- Enzymes that construct IPC are excellent drug targets given that this important surface molecule is not produced in humans

Implications: Tritryp genomes help show unique biology of Leishmania and give insight to Eukaryote evolution

- Differences from other eukaryotes: post-translational modification
 - polycistronic gene clusters
 - mRNA trans-splicing coupled with polyadenylation
- Leishmania branched off from other eukaryotes very early on
 - Differences arose after branching off of Leishmania

Full genome provides crucial information for new therapies of Leishmaniasis

- analysis of virulence factors
- enzymes in metabolic pathways
- potential vaccine candidates

<http://www.dailymail.co.uk/health/article-1191257/Ben-Fogle-I-nearly-lost-half-face-flesh-eating-bug--The-cure-injections-poison.html>

Conclusion

- Leishmania: sub-tropical parasite that causes Leishmaniasis, an infection affecting 2 million people annually
- 36 chromosomes sequenced
 - compared to Tritryp organisms and humans to understand biology and function of Leishmania genes
- Drug targets were found in both post translational modification enzymes and in surface molecules
 - Full genome allows for analysis and development of therapies
